

EASYLAW: COMPREHENSIVE SYSTEM DOCUMENTATION

Dashboard Interfaces, End-to-End Workflows, Call Routing, and SLA Configurations

Project Name	EasyLaw Academic Prototype	System Scope	Client, Lawyer, & Admin Portals
Documentation ID	EASYLAW-SYSTEM-DOC-v3.0	Last Updated	July 17, 2026

1. Introduction & Core Objective

EasyLaw is an on-demand legal advisory platform designed to connect clients seeking legal assistance with verified professional advocates in real-time. The platform automates lead ingestion, assigns cases to appropriate lawyers based on categories and location, collects service fees, and bridges calls securely using telecom masking technologies. This document details the dashboard interface operations and the interconnection matrix.

2. Portal Dashboards: Features & Views

The system is split into three dashboard environments, each tailored to specific functional roles.

2.1. Client Dashboard

The Client Dashboard is the control hub for a user seeking legal help. It is designed to be extremely clean and responsive, featuring the following sections:

- Intake Form Console:** A multi-step form where clients enter their name, phone number, select a location (Delhi, Ghaziabad, or Gautam Buddha Nagar), choose one of the 9 legal categories, and input their legal brief.
- Consultation Status Tracker:** A real-time timeline that polls the database every 5 seconds to update the user. It displays states: Pending Match, Assigned (Advocate details displayed), Call in Progress, and Completed.
- Advocate Profile Card:** Once a lawyer accepts the case, this card dynamically updates to show the advocate's legal credentials, Bar Association registration number, years of experience, and specialization rating.
- Post-Consultation Feedback Modal:** A popup triggered when the call is logged as complete. It allows the client to rate the lawyer on a scale of 1 to 5 stars and type reviews, which are instantly linked to the lawyer's database stats.

2.2. Lawyer Dashboard

The Lawyer Dashboard provides advocates with a mobile-first interface to manage incoming clients and track their payouts. It contains 5 key tabs:

- Availability Control:** A prominent offline/online toggle button. Changing this updates their status in the database to active, making them eligible for auto-matching with incoming client leads.
- Calls Hub:** Lists pending, matched, and incoming requests showing the client's name, category, and legal brief. The lawyer can review the details and click "Accept Case" to initiate the call bridge.

- **Cases History Log:** Lists all previously resolved, cancelled, or forwarded legal bookings, detailing dates, call durations, and customer reviews.
- **Schedule Management:** Allows advocates to set customized consultation time blocks and manage calendar appointments.
- **Earnings Ledger:** A real-time analytics window showing total consultations resolved, commissions earned, and payout statuses.

2.3. Admin Panel (Control Tower)

The Administrator Dashboard provides full control over the system database and call integrations:

- ****Global Lead Directory:**** Displays all active and historical cases. Admins can view, edit, or delete lead details, manually change statuses, or check payment transactions.
- ****Advocate KYC Verification Console:**** Lists new lawyer signups. Admins review uploaded Bar Council Certificates, bar license ID numbers, and experience claims to approve or block accounts.
- ****Manual Override & Dispatch Panel:**** Allows the admin to override the automated matching algorithm. The admin can manually assign a lead to a specific lawyer or trigger the Exotel call bridge manually if a system error occurs.
- ****Telecom & Audit Registry:**** Shows telecom reports, including call logs, start/end timestamps, actual talk times (duration in seconds), and links to call recordings.

3. Interconnection Workflow Matrix

Below is the step-by-step transaction map detailing how the client, lawyer, and admin dashboards interact in real-time to execute a booking.

Step	Client Dashboard Action	System / Database Event	Lawyer Dashboard Action	Admin Panel Action / View
1	Client submits intake and completes payment.	Saves Lead; sets status to PAID; flags as Flow 2 (ASAP).	No active event yet.	Lead appears on Admin Dashboard under the active Flow 2 queue.
2	Displays "Searching for Lawyer..." spinner.	Triggers matching algorithm. Finds online advocates matching category and city.	Rings notification alert and shows client brief card under **Calls Hub** .	Admin tracks the list of matching advocates notified by the system.
3	Spinner changes to show "Advocate Assigned" card with lawyer credentials.	Lawyer accepts. Status updates to ASSIGNED. Server dials Exotel API.	Clicks **Accept Case** ; screen shows "Initiating call bridge..."	Lead status updates in real-time. Override option disabled.
4	Client answers phone call from virtual masking number.	Exotel dials lawyer first, once answered, dials client, and bridges calls.	Answers phone call from virtual masking number. Speaks to client.	Admin registry shows "Call Active" status.
5	Timeline updates to show "Consultation Complete". Displays rating modal.	Call hangs up. Webhook logs duration, updates status to COMPLETED.	Dashboard returns to active calls list. Availability state resumes.	Admin panel logs call duration, charge details, and recording link.

4. SLA (Service Level Agreement) Configurations

The platform runs background services to manage response timeouts and client drop-offs:

- ****Lead Acceptance SLA (15 Mins):**** If a lead is not accepted by any online lawyer within 15 minutes, it is escalated to ****Flow 4 (Emergency)**** on the Admin panel, triggering audio-visual alerts.
- ****Incomplete Intake SLA:**** If a client drops off during form completion, the system sends re-engagement nudges at ****T+30 minutes**** and ****T+4 hours**** on WhatsApp, before expiring the session at ****T+24 hours****.
