

EASYLAW: ACADEMIC PROJECT REPORT

An On-Demand Legal Consultation Platform Connecting Clients and Verified Advocates Instantly

Project Title	EasyLaw: Legal Advisory Platform	Scope	Full-Stack Cloud Monorepo Solution
Documentation Version	EASYLAW-PROJECT-DOC-v1.0	Last Updated	July 17, 2026

1. Project Abstract & Objective

Access to timely and reliable legal counsel remains a major challenge in developing nations. Standard directories list profiles but fail to facilitate active connections, while traditional consulting models require face-to-face appointments and high upfront retainer fees. **EasyLaw** is designed to address this problem by bridging the gap between clients and advocates.

EasyLaw is a secure, cloud-based Progressive Web App (PWA) that allows users to submit their legal issues online and receive an instant, bridged telephonic consultation with a verified legal advocate in under 60 minutes. The system integrates payment gateways, automated call routing with phone number masking, and structured case management dashboards.

2. System Architecture & Modules

The system is organized into three distinct, interconnected user modules:

2.1. Client Module

- Account Registration:** Mobile authentication and user profile setup.
- Case Intake Form:** A guided form to input location (city), select legal category, provide brief description, and choose preferred callback time (ASAP or scheduled).
- Payment Gateway Integration:** Direct payment checkout using UPI, NetBanking, and credit/debit cards to secure the consultation.
- Case Tracking Timeline:** Visual step-by-step progress tracking showing the lawyer assignment status and call completion details.

2.2. Lawyer (Advocate) Module

- **Credential-Based Onboarding:** Submission of bar council enrollment certificates, state bar licenses, photo IDs, and practice experience details.
- **Availability Console:** A simple toggle switch allowing lawyers to go "Active & Receiving Calls" or "Offline" dynamically.
- **Call Request Handler:** Direct mobile alerts informing advocates of newly matched clients and booking details.
- **Earnings Ledger:** Transparent records of successful consultations and payout histories.

2.3. Administrative Module (Admin Panel)

- **Advocate KYC Verification:** A review panel to verify lawyers' bar council certificates and approve or reject their access.
- **Interactive Lead Management:** Monitor all cases in the queue and categorize requests based on urgency.
- **Call Log Registry:** Audit records of bridged calls, durations, and system timestamps.

3. Core Workflows & Processing Engines

EasyLaw operates using automated, event-driven engines to route data and calls securely.

3.1. Case Intake & Flow Classification

When a client submits a case, the system parses the time selection and automatically groups the lead into one of four priority queues (Flows) on the Admin Panel:

- **Flow 1 (Manual Callback):** Standard cold request requiring manual followup.
- **Flow 2 (ASAP Consultation):** High-priority callback request. The system targets lawyer match and callback within 60 minutes.
- **Flow 3 (Scheduled Later):** Client prefers a callback later in the day.
- **Flow 4 (Emergency/Escalated):** Critical legal status matching immediate attention flags.

3.2. Secure Call Routing & Bridging Engine

To comply with data privacy standards and prevent number exposure, EasyLaw uses a custom telephony bridging engine (powered by Exotel API):

Double-Masked Call Flow:

1. When a lawyer accepts a request, the server initiates an outbound bridge call via the Exophone server.
2. The system dials the **Lawyer's phone number first**.
3. Once the lawyer answers the call, the system automatically dials the **Client's phone number**.
4. The two calls are bridged together. Both parties talk directly, but they only see the virtual Exophone routing number on their screens. **Private phone numbers remain completely hidden.**
5. Once the call is hung up, the server receives a webhook callback with the call duration to mark the case as resolved.

4. Conversational WhatsApp Integration

In addition to the web app, EasyLaw supports a fully integrated WhatsApp Bot (using Meta Cloud API) allowing clients to book cases via chat. The bot operates as a guided state machine collecting name, verified number, city, practice area, and terms agreement, and automatically creates the case in the main database.

5. Security & Legal Compliance

- **Personal Data Protection:** Compliant with India's Digital Personal Data Protection (DPDP) Act, 2023, by encrypting user details in transit (HTTPS) and securing call log registers.
- **Indian Telecom Regulations (TRAI):** All SMS communications and OTPs are routed through registered Distributed Ledger Technology (DLT) channels with pre-approved headers and templates to avoid network blocking.
