

EASYLAW: COMPREHENSIVE SYSTEM DOCUMENTATION

Detailed Functional Specifications, Lifecycle Workflows, and SLA System Configurations

Project Name	EasyLaw Academic Prototype	System Scope	Intake, Payment, Call-Routing, & SLAs
Documentation ID	EASYLAW-SYSTEM-DOC-v2.0	Last Updated	July 17, 2026

1. Introduction & Core Objective

EasyLaw is an on-demand legal advisory platform designed to connect clients seeking legal assistance with verified professional advocates in real-time. The platform automates lead ingestion, assigns cases to appropriate lawyers based on categories and location, collects service fees, and bridges calls securely using telecom masking technologies. This document serves as the full functional architecture report detailing the system flows and Service Level Agreements (SLAs).

2. End-to-End Lead Lifecycle Workflow

Every case registered in EasyLaw moves through a highly structured 7-stage lifecycle. Below is the step-by-step description of how a case progresses from initial creation to final resolution.

1. Stage 1: Lead Ingestion & Form Intake
- The client accesses the EasyLaw web application or WhatsApp bot and fills out the legal intake form. They provide their Full Name, 10-digit Phone Number, Location (Delhi, Ghaziabad, or Gautam Buddha Nagar), Issue Category (such as Family & Marriage, Property, Criminal, or Corporate), and a detailed description. The client selects their preferred consultation time (ASAP or Later Today).
2. Stage 2: Flow Categorization & Database Entry
- The backend saves the case as a new **Lead** record in the database. The system automatically categorizes the lead into one of four operational queues based on time preferences:
- Flow 2 (ASAP):

The system prioritizes immediate matching. The target window to connect the client to a lawyer is 60 minutes.

Flow 3 (LATER):

The case is placed in a scheduled queue for advocate matching later in the day.
3. Stage 3: Payment Authorization
- Before matching begins, the client is redirected to the Payment Page. The gateway (Razorpay/PhonePe) processes the consultation fee. Once authorized, the payment status updates in the database, triggering the matching algorithm.
4. Stage 4: Advocate Matching Algorithm
- The backend searches for registered advocates who match the **City** and **Legal Category** of the lead. The system checks which of these lawyers are currently marked as **"Active & Receiving Calls"** (Online). A push notification or dashboard alert is sent to the matched lawyers.
5. Stage 5: Case Acceptance

The lawyer views the brief description on their dashboard and clicks **"Accept Case"**. Once accepted, the lead status changes to ASSIGNED, and the matching engine halts further notifications.

6. Stage 6: Telephony Bridging (Exotel Connection)

The server immediately triggers the Exotel click-to-call bridging API. The telephony server dials the **Lawyer's number first**. As soon as the lawyer answers, the server dials the **Client's number** and bridges the two lines together. Both parties talk directly, but their caller IDs show a virtual masked number (no private numbers are shared). Once the call ends, a callback webhook logs the call duration and recording URL in the database.

7. Stage 7: Resolution & Feedback

The case status changes to COMPLETED. The client is prompted to provide a rating (1 to 5 stars) and feedback text, which updates the lawyer's public rating metrics.

3. SLA (Service Level Agreement) Engines

To ensure high responsiveness and prevent lead drop-offs, the backend features three automated background cron engines that run every 5 minutes.

3.1. Incomplete Intake SLA Engine (Drop-off Recovery)

If a client starts filling out the intake form but drops off before completing the registration or payment:

- ****T+30 Minutes (Nudge 1):**** The system detects the idle state and sends an automated WhatsApp re-engagement nudge asking the user if they want to resume their draft.
- ****T+4 Hours (Nudge 2):**** If still incomplete, a final reminder is sent stating that advocates specializing in their category are active and waiting to consult.
- ****T+24 Hours (Expiry):**** If the user does not respond, the session is marked as expired and cleared from active queues. The draft remains cached in their local browser storage for easy manual retrieval.

3.2. Response & Matching SLA Engine (Advocate Fallback)

For high-priority cases (Flow 2 - ASAP):

- ****T+15 Minutes (No acceptance):**** If a lead is created but no online lawyer clicks "Accept" within 15 minutes, the system immediately escalates the lead to ****Flow 4 (Emergency/Escalated)**** in the Admin Panel.
- ****T+5 Minutes (No answer on call):**** If a lawyer accepts a case but fails to answer the incoming Exotel bridge call, the case is immediately returned to the queue, and an alert is sent to the admin.
- ****Admin Override:**** The admin is alerted on their dashboard via audio/visual banners and can manually assign the lead to any available lawyer in the database, bypassing the matching engine.

3.3. Lawyer Verification SLA

To maintain platform quality, all newly registered lawyer accounts are locked in a "Pending Review" status. The admin dashboard lists these applications, showing Bar council certificates and licenses. The admin must verify these manually. Once approved, the lawyer receives an automated credentials email allowing them to go online and accept cases.

4. Core Database Schema & Mappings

The platform relies on the following database model relationships to track case flow:

- ****User Model:**** Stores account details, roles (CLIENT, LAWYER, ADMIN), and authentication tokens.
- ****LawyerProfile Model:**** Linked to User; contains Bar Council registration numbers, experience years, categories, rating averages, and their active availability status.
- ****Lead Model:**** Contains location, category, description, payment associations, assigned lawyer IDs, and preferred time values (ASAP, LATER).
- ****Booking Model:**** Created when a lawyer accepts a lead, linking the client, lawyer, and payment record together.
